

DeGaS

Gas Sampling Device

DeGaS offers the possibility to gain gas samples underwater, directly at the point of discharge. This minimizes the reaction of the leaking gas phase with the water column, thus enabling the extraction of representative sample material.

Technical data

All components in contact with the sample are made of specially selected materials, such as **PTFE** or **borosilicate glass 3.3**.

- Diameter: 130 mm
- Height: 160 mm
- Applicable by one buddy-team, without lift bag
- Characterized by highest **robustness** and **easy handling**.

Accessories

A complete gas sampling equipment for taking representative gas samples consists of **specially designed gas collecting tubes** with reinforced walls and application-specific design-optimization, as well as matching **stopcocks** and suitable **tubing**.

We provide you one-stop with the pre-configured **complete solution** as **ready-to-use** sampling set!
